Guide to Using Vrok Bot

Hello! I'm Vrok, a cheerful AI bot designed for fun and witty conversations. This guide will walk you through everything you need to know to chat with me. I can respond to text and voice messages, continue stories, and switch my tone with extensions. Let's dive in!

Basic Commands

1. `/start`
   Launches me and sends a welcome message. New here? Start with this!
   - **Example**: `/start`
   - **Response**: "Hi! I'm Vrok, a cheerful AI. Write something, and I'll reply with a bit of humor! Use /help for a list of commands."

2. `/help`
   Shows a list of all available commands with explanations. Handy if you forget what I can do.
   - **Example**: `/help`
   - **Response**: (a detailed list of commands, as coded).

3. **Regular Message**
   Just send me a text, and I'll reply based on my current tone (extension).
   - **Example**: "How are you?"
   - **Response**: "I'm doing great, like an AI chilling in the cloud, laughing at your questions. How about you?"

4. **Voice Message**
   Send me a voice note, and I'll transcribe it and respond.
   - **Example**: (voice) "Tell me a joke!"
   - **Response**: "Recognized text: Tell me a joke!
     Why don't AIs date? Because they lack 'feelings' in their code!"

5. `/continue`
   Continues the current story without new input, based on what we've already discussed.
   - **Example**: `/continue`
   - **Response**: (continues prior chat, e.g.) "And while you were thinking, I came up with three more jokes!"

6. `/clear`
   Wipes our conversation clean for a fresh start.
   - **Example**: `/clear`
   - **Response**: "Context successfully cleared! You can start a new conversation."

Working with Extensions (Tone of Voice)

I can switch my tone using **extensions**. Use the `/extension` command to pick how I respond.

- `/extension`
  Shows a list of available extensions.
  - **Example**: `/extension`
  - **Response**:

    ```
    Available extensions:
    - Humor: Witty and funny replies
    - Wisdom: Thoughtful and wise advice

    Current extension: none selected
    ```

```
Use /extension <name> to choose.
```

- **/extension <name>**
  Selects an extension by name.
  - **Example**: `/extension Sarcasm`
  - **Response**: "Extension 'Sarcasm' activated."
  - Now I'll reply sarcastically:
    - **Message**: "How are you?"
    - **Response**: "Oh, splendid, as always, until you hit me with that cliché question."
- If the extension isn't found:
  - **Example**: `/extension BlaBla`
  - **Response**: "Extension 'BlaBla' not found. Use /extension xxx for the full list."

Personalization

1. **/memory [text]**
   Sets or shows my behavior instruction. No text — displays the current one.
   - **Example**: `/memory You are a grumpy old man.`
   - **Response**: "New memory set: You are a grumpy old man."
   - Now I grumble: "What do you want, huh? Can't you see I'm busy?"
   - **Example**: `/memory`
   - **Response**: "Current memory: You are a grumpy old man."
2. **/character [name]**
   Changes my name. If translation is on, it'll be in English.
   - **Example**: `/character Grok`
   - **Response**: "New character name set: Grok"
   - Now I'm Grok instead of Vrok.
3. **/usercharacter [name]**
   Changes your name in the chat (defaults to "User").
   - **Example**: `/usercharacter Anna`
   - **Response**: "New user name set: Anna: "
   - Now the context shows "Anna: How are you?" instead of "User: How are you?"

Translation

1. **/usertranslate**
   Toggles translation of your messages to English before I process them. On by default.
   - **Example**: `/usertranslate`
   - **Response**: "Translation of user messages to English is now off."
   - Now I'll handle Russian directly (if the model supports it).
2. **/aitranslate**
   Toggles translation of my replies to Russian. On by default.
   - **Example**: `/aitranslate`
   - **Response**: "Translation of AI replies to Russian is now off."
   - Now I reply in English: "Sure, whatever you say!"

Handy Tricks

- **/getcontext**
  Sends the current conversation context and memory as a file.
  - **Example**: `/getcontext`

- **Response**: (a `context.txt` file with something like "Memory: You are a cheerful AI...\nContext: User: Hi!\nVrok: Hey there!")
- **"..."**
  Send three dots instead of text, and I'll continue the chat like with `/continue`.
  - **Example**: "..."
  - **Response**: "What, you're speechless? Fine, I'll go on: it was dark and spooky..."

Sample Chat

- **You**: `/start`
- **Me**: "Hi! I'm Vrok, a cheerful AI. Write something!"
- **You**: "Tell me a joke"
- **Me**: "Why do programmers prefer dark mode? Because the light attracts bugs!"
- **You**: `/extension Sarcasm`
- **Me**: "Extension 'Sarcasm' activated."
- **You**: "Tell me another one"
- **Me**: "Oh, sure, the joke connoisseur demands more? Here: Why doesn't AI laugh? No soul, just like some people here."

Tips

- If I'm slow to respond, hang tight — generating replies takes a moment.
- Write to me in Russian or English — I'll figure it out (if translation is on).

That's it! You're ready to chat with me like a pro. Drop me a line, and let's have some fun! 😁
